BASIC LAWN CARE GUIDE FOR FESCUE LAWNS

February 15th - April 15th -- Apply a fertilizer with nitrogen (19-0-3 or similar) with pre-emergent weed control once. Spray existing weeds with Speedzone or a similar selective herbicide.

April 15th - May 31st -- Apply a nitrogen-free fertilizer (such as 0-0-7 with Iron) with pre-emergent weed control once. Spot spray weeds with Speedzone. Look for grub worm activity; treat as needed. Apply preventative fungicide in May if you had to treat it last year.

June - July -- Look for semi-circular brown spots in your lawn caused by fungus. Treat with Headway or similar fungicide as needed. Spot spray weeds as needed when temps are below 85 degrees.

September - October -- Core aerate lawn, apply fertilizer (Horganix 7-9-5 or 18-24-12), and seed. Apply lime now or in mid-winter, once per year.

November - December -- Apply a high nitrogen fertilizer (32-0-6 or similar) to keep your lawn green all winter.

***** For an organic option, substitute Horganix 7-9-5 fertilizer in spring and fall. Additionally, you can spread 1/4" - 1/2" of organic compost over the lawn. *****
